

A now fixed CO_2 increase is given as input for climate models

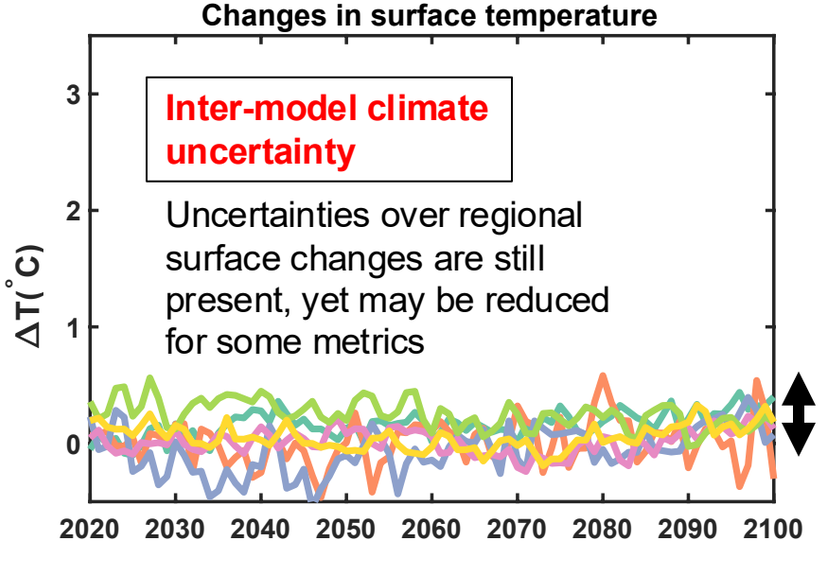

Strategy and target uncertainty

The injection of SO_2 is prescribed in a specific way (location and time) and so is the cooling target (from SSP5-8.5 to SSP2-4.5).

This collapses these two kind of uncertainties in this specific modeling exercise

A cooling target is decided in the modeling exercise, leading to converging global temperatures

A prescribed amount of cooling can be produced differently by different models
